The Yavapai Library Network has upgraded the catalog and database servers.

The Yavapai Library Network has recently upgraded its catalog and database servers. Searches now take place considerably faster than they did before reducing the amount of time required to find a specific item. The amount of time that a librarian needs to checkin and checkout books is also considerably reduced. This upgrade was critical for increased server performance and efficiency. Library users can see the improvements first hand by browsing their libraries' catalog. The catalog can be found by clicking on the Catalogs button on the portal.yln.info site.
